Linear regression in terms of kernel

• Reminded that the multivariate regression $y \sim X w$:

$$\hat{m{y}} = m{X}\hat{m{w}} = m{H}m{y}, \quad ext{where} \quad \hat{m{w}} = \underbrace{m{S}m{X}^Tm{y}}_{(p imes 1)}, \ m{H} = \underbrace{m{X}m{S}m{X}^T}_{(N imes N)}, \ m{S} = \underbrace{(m{X}^Tm{X})^{-1}}_{(p imes p)}$$

ullet The estimation \hat{y}_* for a new value $oldsymbol{x}_*$ is obtained as

$$\hat{y}_* = \boldsymbol{x}_* \hat{\boldsymbol{w}} = \underbrace{\boldsymbol{x}_* \boldsymbol{S} \boldsymbol{X}^T}_{(1 \times N)} \boldsymbol{y} = \sum_i \underbrace{(\boldsymbol{x}_* \boldsymbol{S} \boldsymbol{x}_i^T)}_{\text{scalar}} y_i = \sum_i \underbrace{\phi(\boldsymbol{x}_*) \phi(\boldsymbol{x}_i)^T}_{\text{inner product}} y_i = \sum_i \underbrace{K(\boldsymbol{x}_*, \boldsymbol{x}_i)}_{\text{kernel}} y_i$$

where $\phi(\boldsymbol{x}) = \boldsymbol{x}\boldsymbol{S}^{1/2}$ is from \mathbb{R}^p to \mathbb{R}^p .

• The kernel, $K(\boldsymbol{x}_*, \boldsymbol{x}_i)$,

$$K(\boldsymbol{x}_*, \boldsymbol{x}_i) = \boldsymbol{x}_* \boldsymbol{S} \boldsymbol{x}_i^T = \phi(\boldsymbol{x}_*) \phi(\boldsymbol{x}_i)^T$$

is understood as the influence of a training sample x_i on a test sample x_* .

• In linear regression, kernel is defined as the inner product between linear function $\phi({m x}).$

Jaehvuk Choi (PHBS) MLF: Kernel Method 2022-23 M3 2 / 1

Generalizing kernel

- Kernel does not need to use a linear feature map $\phi(x)$. E.g., polynomial function: $\phi(x) = (x, x^2, x^3, \dots, x^d)$
- Kernel does not have to use an inner product as long as K(x, y) satisfy some conditions (e.g., higher value for close pair).
- Examples:
 - Polynomial kernel:

$$K(\boldsymbol{x} \in \mathbb{R}^{2}, \boldsymbol{y} \in \mathbb{R}^{2}) = (1 + \boldsymbol{x}\boldsymbol{y}^{T})^{2} = (1 + x_{1}y_{1} + x_{2}y_{2})^{2} = \cdots$$

$$= (1, \sqrt{2}x_{1}, \sqrt{2}x_{2}, x_{1}^{2}, \sqrt{2}x_{1}x_{2}, x_{2}^{2}) \cdot (1, \sqrt{2}y_{1}, \cdots)$$

$$= \phi(\boldsymbol{x})\phi(\boldsymbol{y})^{T}, \text{ where } \phi(\boldsymbol{x}) : \mathbb{R}^{2} \to \mathbb{R}^{4}$$

Radial basis kernel (RBF):

$$K(\boldsymbol{x}, \boldsymbol{y}) = \exp\left(-\gamma \|\boldsymbol{x} - \boldsymbol{y}\|^2\right)$$

The corresponding $\phi(x)$ exists, but is ∞ -dimensional $(\mathbb{R}^p \to \mathbb{R}^\infty)$.

• Sigmoid kernel:

$$K(\boldsymbol{x}, \boldsymbol{y}) = anh\left(a \boldsymbol{x} \boldsymbol{y}^T + b\right)$$

Kernel PCA

- We extend PCA analysis to the feature map $\phi(x)$, but using the kernel $K(x_i, x_j)$ only (not $\phi(\cdot)$).
- The covariance matrix of $\phi(x)$ is given by

$$\boldsymbol{\Sigma} = \frac{1}{N} \phi(\boldsymbol{X})^T \phi(\boldsymbol{X}) \quad \text{assuming} \quad E(\phi(\boldsymbol{x})) = \boldsymbol{0}.$$

ullet A PCA direction $oldsymbol{v}$ (p imes 1) and the eigenvalue λ satisfy

$$\lambda \boldsymbol{v} = \boldsymbol{\Sigma} \boldsymbol{v} = \frac{1}{N} \phi(\boldsymbol{X})^T \phi(\boldsymbol{X}) \boldsymbol{v} \quad \Rightarrow \quad \boldsymbol{v} = \phi(\boldsymbol{X})^T \boldsymbol{a} \quad \text{for} \quad \boldsymbol{a} = \underbrace{\frac{1}{\lambda N} \phi(\boldsymbol{X}) \boldsymbol{v}}_{(N \times 1)}$$

• Substituting $m{v}$ into $\lambda m{v} = m{\Sigma} m{v}$ and using $m{K} = \phi(m{X}) \phi(m{X})^T$ (N imes N),

$$\phi(\mathbf{X}) \left[\lambda \phi(\mathbf{X})^T \mathbf{a} = \frac{1}{N} \phi(\mathbf{X})^T \phi(\mathbf{X}) \phi(\mathbf{X})^T \mathbf{a} \right]$$
$$\lambda N \mathbf{K} \mathbf{a} = \mathbf{K}^2 \mathbf{a} \implies \lambda N \mathbf{a} = \mathbf{K} \mathbf{a}$$

ullet The vector $oldsymbol{a}$ is an eigenvector of $oldsymbol{K}$ with the eigenvalue λN .

Jaehyuk Choi (PHBS) MLF: Kernel Method 2022-23 M3 4

- $K = \phi(X)\phi(X)^T$ is called Gram matrix. $K_{ij} = K(\phi(x_i), \phi(x_j))$ is the kernel value between i-th and j-th samples.
- ullet The PCA score (projection) of a new vector $oldsymbol{x}_*$ on $oldsymbol{v}$ is

$$y_* = \phi(\boldsymbol{x}_*)\boldsymbol{v} = \phi(\boldsymbol{x}_*)\phi(\boldsymbol{X})^T\boldsymbol{a} = \phi(\boldsymbol{x}_*)\sum_i \phi(\boldsymbol{x}_i)^Ta_i = \sum_i K(\boldsymbol{x}_*, \boldsymbol{x}_i)a_i$$

- The derivation of a and the PCA score never use the function $\phi(\cdot)$.
- Compared to finding the eigenvector in the raw space, kernel PCA is heavier in computation.

$$\Sigma = \frac{1}{N} \phi(\mathbf{X})^T \phi(\mathbf{X}) \quad (d \times d) \quad \text{versus} \quad \mathbf{K} = \phi(\mathbf{X}) \phi(\mathbf{X})^T \quad (N \times N)$$

4□ > 4□ > 4 = > 4 = > = 90

Jaehyuk Choi (PHBS) MLF: Kernel Method 2022-23 M3

• Because $E(\phi(x)) \neq 0$, we obtain K' from the demeaned samples:

$$\phi'(\boldsymbol{x}_i) = \phi(\boldsymbol{x}_i) - \frac{1}{N} \sum_{l} \phi(\boldsymbol{x}_l)$$

The (i, j) component of K' is

$$K'_{ij} = \left[\phi(\boldsymbol{x}_i) - \frac{1}{N}\sum_{l}\phi(\boldsymbol{x}_l)\right] \left[\phi(\boldsymbol{x}_j) - \frac{1}{N}\sum_{l}\phi(\boldsymbol{x}_l)\right]^T$$

$$= K(\boldsymbol{x}_i, \boldsymbol{x}_j) - \frac{1}{N}\sum_{l}K(\boldsymbol{x}_i, \boldsymbol{x}_l) - \frac{1}{N}\sum_{l}K(\boldsymbol{x}_l, \boldsymbol{x}_j) + \frac{1}{N^2}\sum_{l,m}K(\boldsymbol{x}_l, \boldsymbol{x}_m)$$

Finally,

$$K' = K - 1_N K - K 1_N + 1_N K 1_N,$$

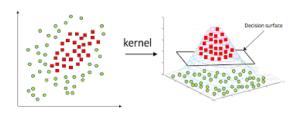

where $\mathbf{1}_N$ is the $N \times N$ matrix whose components are 1/N.

ullet We obtain the top PCA directions from K'.

Kernel trick

- Linear ML methods can be generalized to non-linear methods by simply substituting $x_i x_j^T$ with $K(x_i, x_j)$.
- This is called kernel trick or kernel method.
- Kernel method is memory-based or instance-based algorithm because the method need to sum the influences from all training samples.
- The SVM with non-linear kernel function and kernel PCA are the two important examples.
